

KLM SCROD AUX SRAM (v3)

Change Log

- Extended pad lengths on the mezzanine connector, the SRAM chip, and both sizes of capacitor for ease of soldering
- Cleaned up title, silkscreen, etc. (new Varnerlab logo more prominent!)
- Rerouted many instances of "via in pad" for ease of soldering
 - Had to shift SRAM and touch up all routing to keep ground-planes continuous
- Created and placed new 4-pin Molex power connector and flipped connector to back side
- Investigated image current paths for all traces
 - 3 violations --- I could not fix them but they are not time-critical signals (OEB, UBb, and LBb)
 - Made sure ground vias are placed close to all signal vias
- Made board longer to create envelope for connector in front of motherboard
- Made board shorter (y-direction) to minimize surface area (e.g. cost)
- Removed pointless stitching vias and added grid vias in open spaces to decrease thermal resistance between planes

To Do

- ☕ Double check motherboard edge relative to design to ensure clearance for new connector
- ☕ Shift power connector down and decrease tab height (short portion of PCB) to give maximum clearance for external trig connector and MB-RHIC AI bracket
